

CelluMash

Pressing aid for fruit mashes

Product description

CelluMash is a long-fibred cellulose product, which can be used as a pressing aid for weak-structured fruit mashes.

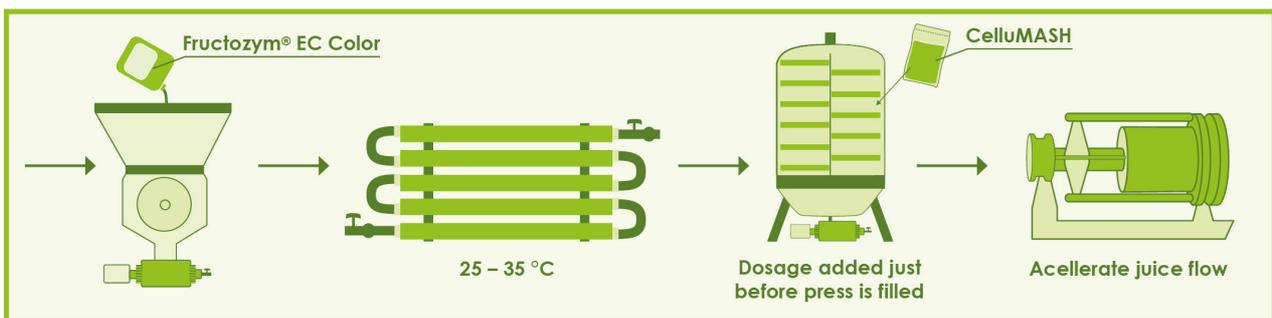

The advantages of using CelluMash are:

- Increased yield as a result of better free juice run
- Better press drainage, as the mucilaginous substances are bound to the fibres
- No additional disposal costs, as CelluMash is 100 % biodegradable and is disposed of with the pomace

Dosage

According to mash quality, the dosage is 0.75 - 3 kg CelluMash pro 100 kg fruit mash. CelluMash should first be added to the mash immediately before pressing. It can be added during mixing, without prior priming or dispersion. Ensure the CelluMash is distributed evenly using mixing equipment.

Example: Strawberry processing

Storage

CelluMash should be stored in a dry, odour-free place. Packs which have been opened should be immediately tightly sealed.
